

At the Generonic Boundary: Where Measurements Become Symbols

Language as a Nonlinear Dynamical System

KEVIN R. HAYLETT

JUN 17, 2026

Prologue: On the Shore

We begin not with a definition, but with an image. Imagine a shoreline; on one side, the land; solid, measurable, the territory of artefacts. On the other, the sea is fluid and a tide of possibility, the unformed. Between them, there is a boundary that is neither one nor the other. A line that shifts with every wave, every footstep, every measurement.

This is the *generonic boundary*.

It is the place where symbols are created and measured. Where artefacts emerge from the tide and return to it. Where meaning is not found but traversed.

This essay, and the words within, is an attempt to map that boundary. It is not to claim mastery over the boundary, but to walk its length and describe what we see. The map is the tide and the tide is the map and we are the walkers on the shoreline.

I. The Illusion of “Abstraction”

Western philosophy has long been haunted by a ghost: *the ghost of abstraction*. From Plato’s Forms to Kant’s noumena, we have been told that true reality lies elsewhere, that is to say it is beyond the senses, beyond the text, beyond the measurable.

However, this is a sleight of hand.

When we speak of “abstraction”, we are often hiding a simpler truth: we are describing artefacts that have been measured in a particular way. The integers are not abstract; they are a series of finite symbolic operations. The group axioms in mathematics are not metaphysical laws; they are observed regularities in the behaviour of symbols. The “beautiful abstract structures” of mathematics are beautiful measurable and named “structures” i.e. they are symbols.

Measuring the ‘Abstract’

The word “abstraction” functions as a kind of veil that suggests that we have left the world of measurement behind. But we have not, and we cannot. It seems to me that we have merely

standardised our measurements, making them so reliable that we forget they are measurements at all.

This is the first step toward the generonic boundary: recognising that all thought, all language, all mathematics, operates within the realm of measurable artefacts.

Perhaps the difficulty is that some artefacts become so familiar that they no longer look like artefacts. A word looks like a word; a number looks like a number and a theorem looks like a theorem. Yet each carries a history of use, measurement, agreement, correction, and stabilisation. The apparent static nature of a word is the result of compression. Yet the words are finite symbols presented for you to measure.

II. The Text Within Text

Here we encounter the central difficulty: any *model* of language is itself a text. Any theory of meaning is itself a symbolic artefact. Any description of the generonic boundary is itself on the generonic boundary.

This is not a failure of language; it is the very nature of the game.

We are caught in a recursive loop. We create models to explain how we create models. We write texts about how texts generate meaning. In practice we measure our own measurements, you are measuring text now.

This is what I call the text-within-text problem and it is the formal expression of self-reference. It is the reason why any complete description of language must be incomplete and must recognise and embrace its own incompleteness within the words as a feature. A feature that is seen; is not a failing of the model because the representation must represent itself as text-within-text.

However, we can call this recursion and it does not have to mean we cannot move on. Especially as the generonic boundary, where symbols are created, is not a wall; it is a dynamical process. We cross the boundary, as a dynamical process, again and again, creating and measuring, measuring and creating. Each crossing enriches the model, deepens the fractal, reveals new structures.

The key is to recognise the recursion, to name it, and to travel with it. This is the source of what we call “finite”. It is the dynamical process that gives us the measured world.

This is where we need the phrase *functional symbolic trajectory* as a measurement. A word, sentence, equation, proof, or model is not simply a fixed thing. It is a *finite symbolic pathway* that can be followed, measured, compressed, extended, or allowed to fail.

Even a single word is not isolated. It arrives with memory, use, sound, expectation, and provenance. The word may be small, but the trajectory it carries is not.

III. The Two-Way Generonic Process

Early in my work on language as a nonlinear dynamical system, the focus was on the direction of creation: how we create symbols, form models, and generate text. However, with further explorations and investigation, the clearer it becomes: the process is two-way.

- We **create artefacts**—write texts, form equations, generate trajectories.
- We **measure those artefacts**—read, interpret, analyse, test.
- We **create new artefacts** based on our measurements—new texts, new models, new trajectories.

This is not a linear flow; rather it is what can be called a *dialectic*. It is a local process of exchange, an interaction between the generator and the measured, the measurer and the generated.

The Wider Generonic Process

Consider a scientific experiment. The scientist creates an apparatus (an artefact), conducts measurements (observations), and generates a paper (a new artefact). The paper is measured by peers, who create new experiments, new artefacts, new measurements.

Science is not the pursuit of ‘abstract’ truth. It is the relentless crossing of the generonic boundary and the generation of artefacts, such as theories, results, and conclusions.

Language is the same. When I speak, I create artefacts and when you listen, you can measure them. Then when you respond, you create new artefacts, these are thoughts, unspoken or as

functional symbolic trajectories.

In language, we are not just transmitting information; we are co-creating trajectories of symbols. The artefacts are the measured sound, text, the ink on a page, the text committed to silicon memory. The symbols as artefacts are then available for us measure again with our apparatus: instruments, eyes, ears, and the neurons in our mind. And all of this can be written as *text-within-text*. So we can begin to see:

Text is an artefact that we can use to measure, and then refine as a new artefact enabling us to measure again. Text is also an instrument.

Perhaps this is the important measurement. Text is not only representation it is also apparatus. That is to say, Just as a telescope lets us measure light, and a clock lets us measure regularity, text lets us measure representation and this is often what we call *meaning*.

A proof, a poem, a paper, and a conversation are all artefacts placed at the boundary so that something further may be measured.

IV. Grounding Through Measurement

It seems to me the important question then becomes:

How do we ground our words? How do we escape the infinite regress of text-within -text?

The answer, from the boundary of text-within-text is: we cannot escape it. We measure it, we commit to the process, and you are measuring now. From this perspective, grounding is not an end point; it is also a dynamical process. We ground our symbols by anchoring them in measurable artefacts. Then, vitally, we ground our models by testing them against observed regularities. We ground our words by placing them on the boundary and observing how they behave.

This grounding is the process of measurement in the observable world.

In this sense, grounding is not a hidden foundation beneath language or final stone under the structure. Measurement is part of the generonic activity, a dynamical process we do when symbols are created through measurement, use, correction, and shared practice.

This is the scientific stance, understood in its modern sense:

1. We **create a model** (an artefact).
2. We **make predictions** (trajectories).
3. We **measure the outcomes** (observations).
4. We **revise the model** (a new artefact).

This is not a search for “truth” in the “abstract”. It is a disciplined walk along the generonic boundary. Each step is a measurement. Each measurement is a generative process. The symbols and trajectories of thought deepens our understanding of the boundary itself.

Just as the sea and the land are dynamically connected the *generonic boundary* is where they meet. Each and every one of us measures at that boundary finding the meaning in the relationships between words and language. What follows is generative, a thought, writing text; creating a program, or an apparatus, or an instrument. And importantly interacting with each other as we are now; as these words are my proxy, that is to say an artefact created for you to measure.

V. The Fractal Shoreline

When walking this boundary, and measuring it seems to me that the boundary is fractal as each measurement reveals new structures. Each creation opens new vistas and possibilities in language and the creation of new artefacts. The shoreline is not a simple line; it is a coastline of vast complexity, as Mandelbrot showed us. However, it is always finite, as *finite represents measurability*.

- A trajectory of a single sentence is a fractal path through semantic space.
- A conversation is a fractal dance of creation and measurement.
- A model of language is a fractal map of fractal trajectories of words.

And so perhaps we can begin to see there is no end. There is no final grounding on some imagined ‘Platonic truth’. There is only the deepening, the enrichments and dynamical elaboration of structures within structures, trajectories within trajectories. The grounding is by measurement, and this is a process.

The Limits of Measurement

However, this deepening is not infinite; as *infinity is that which cannot be measured*, even in the text-within-text as it points to a process the text can not hold. The generonic process is therefore bounded by our limit of measurement. Each step is a step we can actually take and each measurement is a measurement we can actually make. The fractal landscape of measurements within language is vast, yet it is finite.

Vitally, rather than a limitation; measurement is our grounding. It tells us that we are always walking on stable ground, measuring measurable artefacts, creating measurable symbols that are reliable and work. We are not chasing an infinite regress. We are stepping step by step. We count, and using our instruments including the text itself, determine if the trajectories of language function. We simply and importantly ask within the text, and then the recursion begins as text-within-text:

Do the measurements make sense?

VI. Implications of Finitude

The recognition of finitude and finity, of vast but measurable complexity, carries profound implications for how we understand language, thought, and the generonic boundary itself.

1. Finitude Is Not a Constraint; It Is a Foundation

Firstly, we do not need to invoke infinity as a mystical hidden incantation to explain complexity. The vast is enough; measurable is good enough. We have specialist mathematical tools and a vast array of instruments to help us measure.

This shifts the burden of explanation. We are no longer searching for the “ultimate” or the “absolute.” We are searching for the next step, the finer measurement, the deeper trajectory. Finitude and the finite is not a prison; rather it is the ground beneath our feet.

2. Measurement Is the Ultimate Anchor

Every claim of “abstraction” or “infinity” is a claim that has not yet been measured. It is a placeholder for future measurement.

Secondly, when we say “infinite complexity,” we are really saying “complexity beyond our current ability to measure.” The word “infinite” is a signpost that points to the edge of our instruments’ capacity to measure, and that gives us something to push against. This is the boundary where the new challenges of measurement begin.

By grounding our language in measurement, we replace the ghost of infinity with the discipline of the finite. We say: “Here is what we can measure. Here is what we cannot yet measure. And here is the boundary between them.”

3. The Boundary Is a Horizon, Not a Wall

Thirdly, as we refine our instruments and language itself, the boundary moves. What was once “abstract” becomes measurable and what was once “infinite” becomes vast.

The generonic boundary is not a fixed line, rather it is dynamic. This is not a cause for distress or instability; it is the condition required to investigate and make new measurements. The dynamic process extends the boundary and each measurement opens new territory. The generonic boundary, is the edge of the known, and where we take our measurements.

4. We Are the Limit

Finally, we are the ones who measure and the ones who create the instruments. The boundary is not “out there”. Rather it is at the edge of our capability. And that edge is always dynamic; this is what it means to be alive.

It seems to me that this is a humbling realisation. It places us, those that measure, at the centre of the generonic process, and at the center of life. We are not passive observers of an external reality. We are active participants in the creation and measurement of meaning. From this viewpoint, the limit of measurement is a recognition of our limit. The boundary is our boundary and as we grow and learn, as we refine, as we explore and measure, the boundary moves with us.

VII. A Note on Wittgenstein

Perhaps, we can see philosophy itself as a generonic process as it creates new forms of text and text-within-text. The philosopher, Ludwig Wittgenstein recognising the difficulty wrote:

“The limits of my language mean the limits of my world.”

But he also wrote:

“Whereof one cannot speak, thereof one must be silent.”

For me, I measure this as the voice of someone standing at the boundary of measurement of language, unsure of how to proceed. Wittgenstein saw the text-within-text problem. He saw that language cannot fully describe itself. And he chose silence.

However, silence is now not the only response. Especially as we have new mathematical tools, these are instruments that were unavailable to Wittgenstein such as nonlinear dynamical system theory, and large language models; we can use these to create and measure in new ways and in finer detail. We can recognise that the boundary of language is not a limit but rather a generative edge.

The early boundary says: here language stops; whereas the generonic boundary says: here language is made and happens. It is the place of creation, measurement, and recursion. It is the place where we, as those that measure, walk and find our footing.

VIII. The Scientific Endeavour

Perhaps this text and essay feels like a metaphor and in some ways it is, it is a model and a representation born from a generonic process. However let me aim for clarity; this work is also a scientific endeavour.

- It is **empirical**: we observe the behaviour of symbols.
- It is **experimental**: we create models and test them.
- It is **measurable**: we track trajectories, probabilities, geometries.
- It is **iterative**: we revise our models based on measurement.

This is not mysticism, in the sense of representing an unseen magical world. Historically, “mystical” simply meant hidden and was part of natural philosophy. The goal of science is to

bring the hidden into light, by the process of measurement and science has its own special kind of magic.

So when we talk about a generonic boundary we are considering a formal approach to understanding language as a nonlinear dynamical system. My earlier work on the Takens-Based Transformer is one expression of this approach.

In a nonlinear dynamical system, the observed *signal* is not the whole system, yet it may carry enough structure to reconstruct aspects of the hidden dynamics of a system. Language is a *signal*. A sentence is not the whole system, but it may carry enough of the trajectory and signal to reconstruct, the underlying dynamics. It replaces the search for “meaning” with the reconstruction of trajectories and it grounds its measurements in the geometry of what we call “semantic phase space”. Semantic phase space is a numerical representational space using mathematics as a generonic tool for representation. This process can be seen in more detail in the article below.

Yet, even with these instruments, text is always text-within-text and the model is not a thing outside the model. The model is itself a dynamical map. Poetically we can perhaps say that: the map is a tide and the tide is a map.

IX. The Poetry of Language

There exists a measurable history of the deeper connections that we generate in language. We see this in the works of Lewis Carroll and many minds engaged in the generonic process of language, mathematics, and science.

In earlier times there was less division between many of the words that we use today. The fractal boundaries were less well structured. Yet where there is science and mathematics in language; language also carries poetry and magic. And so we walk and measure and find the attractors in language. In the basin of poetry we also find the light of meaning as we connect our words and measurements.

The Dancers on the Shore

We walk and we measure,

And in the walking we find silver and light,

Not gold, not stone, not fixed decree,

But light that dances on the sands of the shore.

The words are grains of sand, the tide is wide,

Yet both are measured; side by side.

The boundary shifts and the shoreline bends,

Yet as travellers we journey in the tide.

We count the steps, we mark the track,

We know we cannot summon back,

The wave that broke, the sound that fell,

And yet still we measure, still we tell the tale.

For in the telling, we create,

A map that changes as we write,

And yet the map writes the tide,

The tide, the words, a light that grows.

So walk with me, and measure too,

The finite world, vast and true.

The boundary is not a wall or veil,

It is where we hear the ocean's call.

Perhaps, as people, or Attralucians, we step,

Tracing the path in the lantern's light.

The map is tide and the tide is map,

And we are the dancers on the edge of time.

Epilogue: The Map Is the Tide

This essay is an artefact and a text about text-within-text. It is a map of the shoreline, drawn from the shoreline. If you have read this far, you will have been measuring it. Perhaps, as a response, you may create new artefacts. And if you walk with me, you will be crossing the generonic boundary again and again.

The map is the tide and the tide is the map and we are dancers reflecting the light we see on the shoreline.

Note: most articles are posted on both Substack and Medium so you can choose your preferred format for reading.
